Spartan-II 2.5V FPGA Family: DC and Switching Characteristics

DS001-3 (v2.7) September 3, 2003 **Product Specification**

Definition of Terms

In this document, some specifications may be designated as Advance or Preliminary. These terms are defined as follows:

Advance: Initial estimates based on simulation and/or extrapolation from other speed grades, devices, or families. Values are subject to change. Use as estimates, not for production.

Preliminary: Based on preliminary characterization. Further changes are not expected.

Unmarked: Specifications not identified as either Advance or Preliminary are to be considered Final.

Except for pin-to-pin input and output parameters, the AC parameter delay specifications included in this document are derived from measuring internal test patterns. All limits are representative of worst-case supply voltage and junction temperature conditions. Typical numbers are based on measurements taken at a nominal V_{CCINT} level of 2.5V and a junction temperature of 25°C. The parameters included are common to popular designs and typical applications. **All specifications are subject to change without notice.**

T_J	Junction temperature		-	+125	°C

Notes:
1. Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those listed under Operating Conditions is not implied. Exposure to Absolute Maximum Ratings conditions for extended periods of time may affect device reliability.
2. Power supplies may turn on in any order.
3. V_{IN} should not exceed V_{CCO} by more than 3.6V over extended periods of time (e.g., longer than a day).
4. Spartan-II I/Os are 5V Tolerant whenever the LVTTL, LVCMOS2, or PCI33_5 signal standard has been selected. With 5V Tolerant I/Os selected, the Maximum DC overshoot must be limited to either +5.5V or 10 mA, and undershoot must be limited to either –0.5V or 10 mA, whichever is easier to achieve. The Maximum AC conditions are as follows: The device pins may undershoot to –2.0V or overshoot to +7.0V, provided this over/undershoot lasts no more than 11 ns with a forcing current no greater than 100 mA.
5. Without 5V Tolerant I/Os selected, the Maximum DC overshoot must be limited to either V_{CCO} + 0.5V or 10 mA, and undershoot must be limited to –0.5V or 10 mA, whichever is easier to achieve. The Maximum AC conditions are as follows: The device pins may undershoot to –2.0V or overshoot to V_{CCO} + 2.0V, provided this over/undershoot lasts no more than 11 ns with a forcing current no greater than 100 mA.
6. For soldering guidelines, see the Packaging Information on the Xilinx web site: http://www.xilinx.com/publications/products/packaging/index.htm

Notes:
1. With no output current loads, no active input pull-up resistors, all I/O pins 3-stated and floating.
2. The I/O leakage current specification applies only when the V_{CCINT} and V_{CCO} supply voltages have reached their respective minimum Recommended Operating Conditions.
3. Internal pull-up and pull-down resistors guarantee valid logic levels at unconnected input pins. These pull-up and pull-down resistors do not provide valid logic levels when input pins are connected to other circuits.

Power-On Requirements

Spartan-II FPGAs require that a minimum supply current I_{CCPO} be provided to the V_{CCINT} lines for a successful power-on. If more current is available, the FPGA can consume more than I_{CCPO} minimum, though this cannot adversely affect reliability.

A maximum limit for I_{CCPO} is not specified. Therefore the use of foldback/crowbar supplies and fuses deserves special attention. In these cases, limit the I_{CCPO} current to a level below the trip point for over-current protection in order to avoid inadvertently shutting down the supply.

Symbol	Description	Conditions		New Requirements(1) For Devices with Date Code 0321 or Later		Old Requirements(1) For Devices with Date Code before 0321		Units
		Junction Temperature(2)	Device Temperature Grade	Min	Max	Min	Max	
I_{CCPO}(3)	Total V_{CCINT} supply current required during power-on	$-40°C \le T_J < -20°C$	Industrial	1.50	-	2.00	-	A
		$-20°C \le T_J < 0°C$	Industrial	1.00	-	2.00	-	A
		$0°C \le T_J \le 85°C$	Commercial	0.25	-	0.50	-	A
		$85°C < T_J \le 100°C$	Industrial	0.50	-	0.50	-	A
T_{CCPO}(4,5)	V_{CCINT} ramp time	$-40°C \le T_J \le 100°C$	All	-	50	-	50	ms

Notes:

1. The date code is printed on the top of the device's package. See the Device Part Marking section in Module 1.
2. The expected T_J range for the design determines the I_{CCPO} minimum requirement. Use the applicable ranges in the junction temperature column to find the associated current values in the appropriate new or old requirements column according to the date code. Then choose the highest of these current values to serve as the minimum I_{CCPO} requirement that must be met. For example, if the junction temperature for a given design is $-25°C \le T_J \le 75°C$, then the new minimum I_{CCPO} requirement is 1.5A. If $5°C \le T_J \le 90°C$, then the new minimum I_{CCPO} requirement is 0.5A.
3. The I_{CCPO} requirement applies for a brief time (commonly only a few milliseconds) when V_{CCINT} ramps from 0 to 2.5V.
4. The ramp time is measured from GND to V_{CCINT} max on a fully loaded board.
5. During power-on, the V_{CCINT} ramp must increase steadily in voltage with no dips.
6. For more information on designing to meet the power-on specifications, refer to the application note XAPP450 "Power-On Current Requirements for the Spartan-II and Spartan-IIE Families"

DC Input and Output Levels

Values for V_{IL} and V_{IH} are recommended input voltages. Values for V_{OL} and V_{OH} are guaranteed output voltages over the recommended operating conditions. Only selected standards are tested. These are chosen to ensure that all standards meet their specifications. The selected standards are tested at minimum V_{CCO} with the respective I_{OL} and I_{OH} currents shown. Other standards are sample tested.

Switching Characteristics

Testing of switching parameters is modeled after testing methods specified by MIL-M-38510/605. All devices are 100% functionally tested. Internal timing parameters are derived from measuring internal test patterns. Listed below are representative values. For more specific, more precise, and worst-case guaranteed data, use the values reported by the static timing analyzer (TRCE in the Xilinx Development System) and back-annotated to the simulation netlist. All timing parameters assume worst-case operating conditions (supply voltage and junction temperature). Values apply to all Spartan-II devices unless otherwise noted.

Notes:

1. Output timing is measured at 1.4V with 35 pF external capacitive load for LVTTL. For other I/O standards and different loads, see the tables **Constants for Calculating T_{IOOP}** and **Delay Measurement Methodology**, page 10.

Calculation of T_{IOOP} as a Function of Capacitance

T_{IOOP} is the propagation delay from the O Input of the IOB to the pad. The values for T_{IOOP} are based on the standard capacitive load (C_{SL}) for each I/O standard as listed in the table **Constants for Calculating T_{IOOP}**, below.

For other capacitive loads, use the formulas below to calculate an adjusted propagation delay, T_{IOOP1}.

$$T_{IOOP1} = T_{IOOP} + Adj + (C_{LOAD} - C_{SL}) * F_L$$

Where:

- Adj is selected from **IOB Output Delay Adjustments for Different Standards**, page 9, according to the I/O standard used
- C_{LOAD} is the capacitive load for the design
- F_L is the capacitance scaling factor

DLL Timing Parameters

Switching parameters testing is modeled after testing methods specified by MIL-M-38510/605; all devices are 100 percent functionally tested. Because of the difficulty in directly measuring many internal timing parameters, those parameters are derived from benchmark timing patterns. The following guidelines reflect worst-case values across the recommended operating conditions.

Symbol	Description	Speed Grade				Units
		-6		-5		
		Min	Max	Min	Max	
$F_{CLKINHF}$	Input clock frequency (CLKDLLHF)	60	200	60	180	MHz

$T_{DLLPWHF}$	Input clock pulse width (CLKDLLHF)	2.0	-	2.4	-	ns
$T_{DLLPWLF}$	Input clock pulse width (CLKDLL)	2.5	-	3.0	-	ns

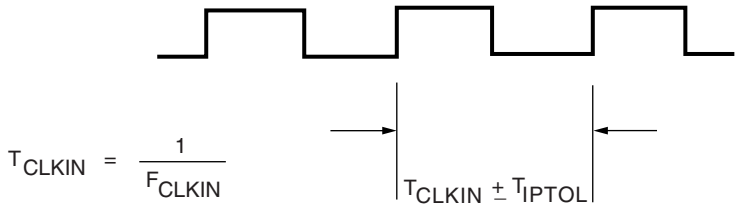
Notes:

1. **Output Jitter** is cycle-to-cycle jitter measured on the DLL output clock, *excluding* input clock jitter.
2. **Phase Offset between CLKIN and CLKO** is the worst-case fixed time difference between rising edges of CLKIN and CLKO, *excluding* output jitter and input clock jitter.
3. **Phase Offset between Clock Outputs on the DLL** is the worst-case fixed time difference between rising edges of any two DLL outputs, *excluding* Output Jitter and input clock jitter.
4. **Maximum Phase Difference between CLKIN an CLKO** is the sum of Output Jitter and Phase Offset between CLKIN and CLKO, or the greatest difference between CLKIN and CLKO rising edges due to DLL alone (*excluding* input clock jitter).
5. **Maximum Phase Difference between Clock Outputs on the DLL** is the sum of Output JItter and Phase Offset between any DLL clock outputs, or the greatest difference between any two DLL output rising edges due to DLL alone (*excluding* input clock jitter).

Period Tolerance: the allowed input clock period change in nanoseconds.



Output Jitter: the difference between an ideal reference clock edge and the actual design.
